

EMPLOYEE ATTRITION ANALYSIS PROJECT

Title Page

Employee Attrition Analysis

A Project Report

Submitted by:

Malavika .P.M

Course: Data Analytics

Abstract

This project focuses on analyzing employee attrition using the Employee Attrition dataset. The main objective is to identify the key factors that influence employees to leave an organization. Tools such as Microsoft Excel and Power BI were used to analyze data including salary, job satisfaction, and work-life balance. The findings show that low job satisfaction, low income, and long distance from home contribute to higher attrition. This project helps organizations take better decisions to improve employee retention.

Objective

The main objective of this project is to analyze employee attrition and identify the factors affecting employee turnover. It also aims to study the impact of salary, job satisfaction, and work-life balance using data analysis tools.

Introduction

Employee attrition is a major challenge faced by organizations. Understanding the reasons behind employee turnover is important for improving productivity and reducing hiring costs. This project analyzes employee data to identify patterns and factors that lead to attrition. Data analytics tools help in visualizing and interpreting these patterns effectively.

Tools Used

- Microsoft Excel
- Power BI

Analysis

The dataset was analyzed using Excel and Power BI. Various charts and dashboards were created to understand trends and patterns.

Key analysis includes:

- Attrition rate calculation
- Department-wise attrition
- Salary vs attrition
- Job satisfaction impact

Conclusion

The project concludes that multiple factors influence employee attrition. By improving job satisfaction, salary structure, and work-life balance, organizations can reduce employee turnover. Data analytics tools help in making better decisions based on data.
